[a] GBS data are available for the accessions in bold font.

Supplemental Table 2 ms command

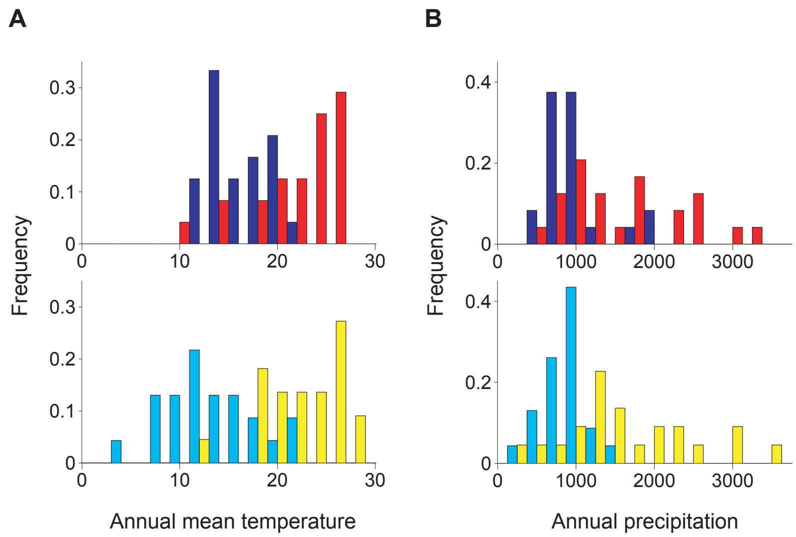
Model I for Mexico populations
Population 1: Mexico lowland population
Population 2: Mexico highland population
-I 2 n_{m1} n_{m2} -n 1 0.3496 -n 2 0.5704 -ej 0.01 2 1 -en 0.01 1 0.92 -en 0.0133 1 0.0163 -en 0.015 1 1.0
Model II for Mexico populations
Population 1: Mexico lowland population
Population 2: Mexico highland population
Population 3: *mexicane* population
-I 2 n_{m1} n_{m2} -n 1 1.125 -n 2 0.375 -es 0.01 2 0.8 -en 0.01 3 1.0667 -ej 0.01 2 1 -en 0.01 1 1.5 -en 0.0133 1 0.0163 -en 0.015 1 1.0 -ej 0.1 3 1
Model I for SA populations
Population 1: SA lowland population
Population 2: SA highland population
-I 2 n_{s1} n_{s2} -n 1 0.5335 -n 2 0.99 -g 2 614.1517 -ej 0.006667 2 1 -eg 0.006667 2 0.0 -en 0.00667 1 0.55 -en 0.01333 1 0.0163 -en 0.015 1 1.0
Model III for SA populations
Population 1: Mexico lowland population
Population 2: SA lowland population
Population 3: SA highland population
-I 3 n_{m1} n_{s1} n_{s2} -n 1 0.64 -n 2 0.342 -n 3 0.99 -g 3 601.1000 -ej 0.006667 3 2 -eg 0.006667 3 0.0 -en 0.006667 2 0.36 -ej 0.01 2 1
-en 0.01 1 1 -en 0.0133 1 0.0163 -en 0.015 1 1.0

Sample size of Mexico lowland, Mexico highland, SA lowland and SA highland populations are denoted by n_{m1}, n_{m2}, n_{s1} and n_{s2}, respectively.

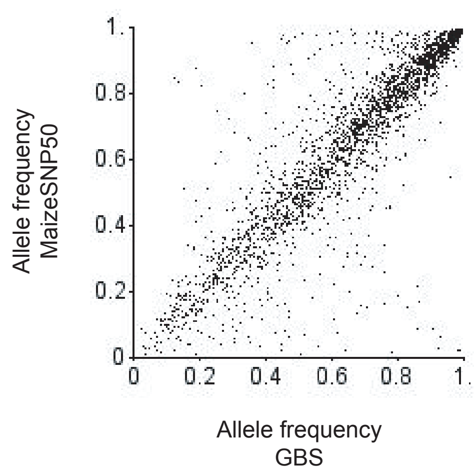
Supplemental Table 3 Inference of demographic parameters

Mexico	Model I	
	Likelihood	-3050.84
	α	0.99
	β	0.42
	γ	1
	σ	1
South America	**Model I**	
	Likelihood	-2737.80
	α	0.6
	β	0.97
	γ	$\geq$55
	σ	1

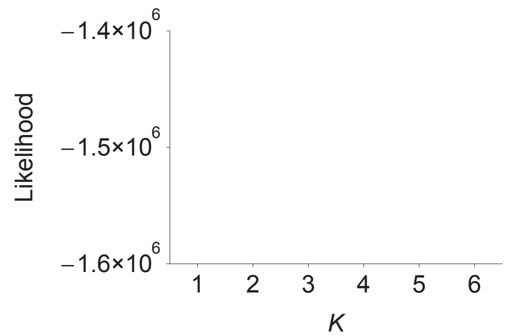
The description of α, β and γ is in Figure 3.
σ is a relative size of N_B to N_C ($N_B = \sigma N_C$).



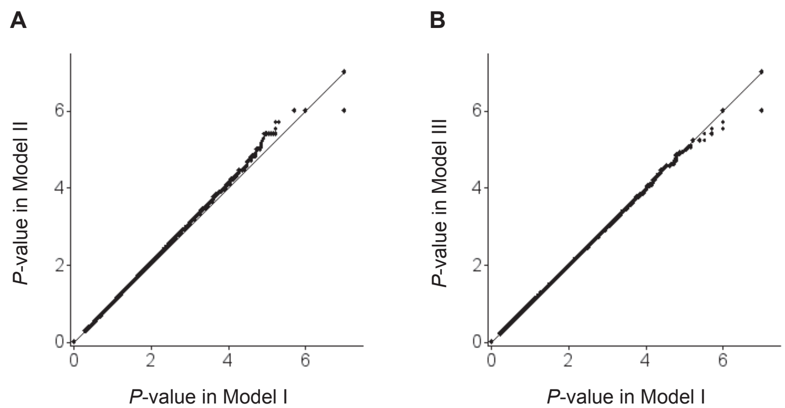
Supplemental Figure 1 Correlation of allele frequencies between GBS (*x*-axes) and MaizeSNP50 (*y*-axes) data. We used overlapped SNPs with $n \geq 40$ for both data sets. Correlation coefficient is 0.890 ($P < 10^{-5}$ by permutation test with 10^5 replications).



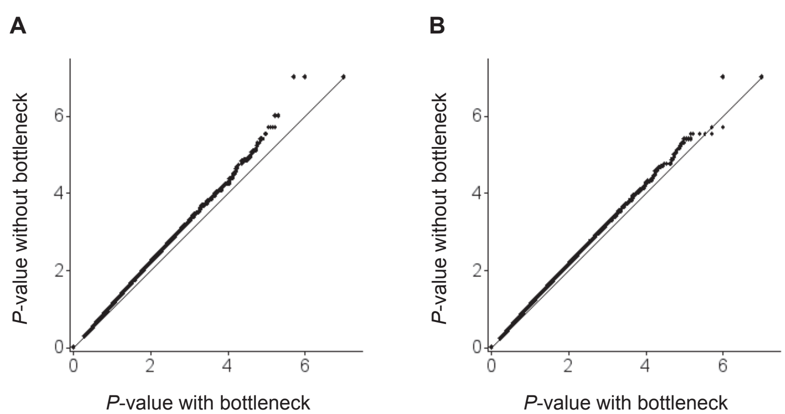
Supplemental Figure 2 Correlation of allele frequencies between GBS (*x*-axes) and MaizeSNP50 (*y*-axes) data. We used overlapped SNPs with $n \geq 40$ for both data sets. Correlation coefficient is 0.890 ($P < 10^{-5}$ by permutation test with 10^5 replications).



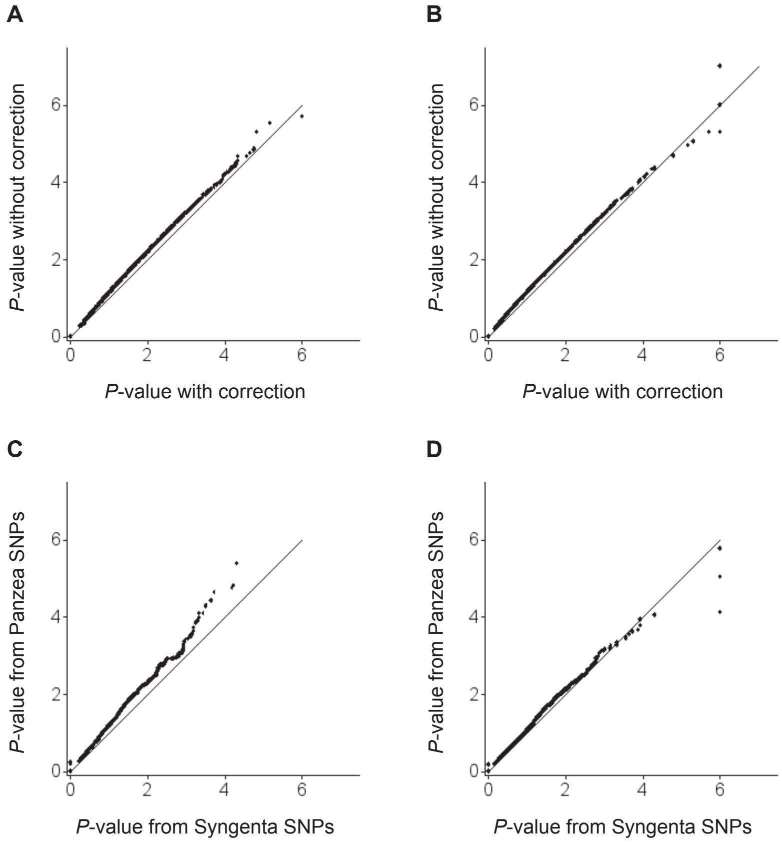
Supplemental Figure 3 Likelihood of STRUCTURE analysis given K. The *x*-axes represents K and the *y*-axes represents likelihood.



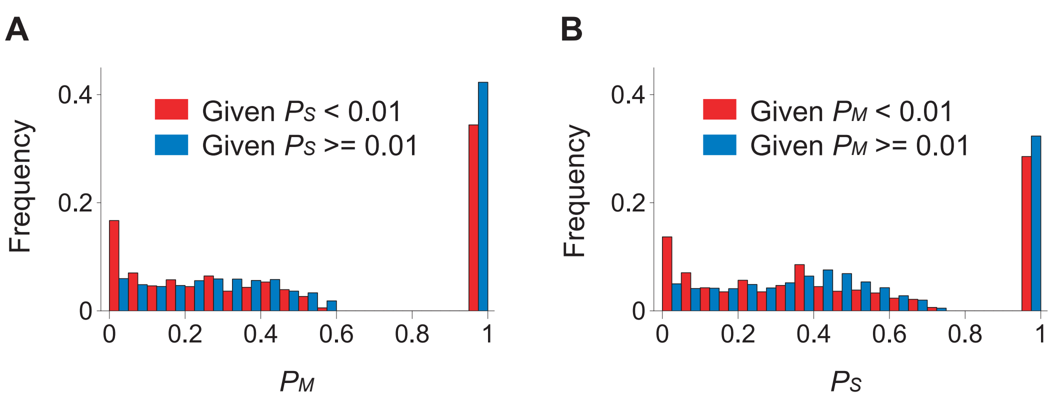
Supplemental Figure 4 Q-Q plot for $-\log_{10}$-scaled *P*-values of population differentiation between models in GBS data. The results of Mexico (A) and South America (B) are shown. The solid lines represent *y*=*x*.



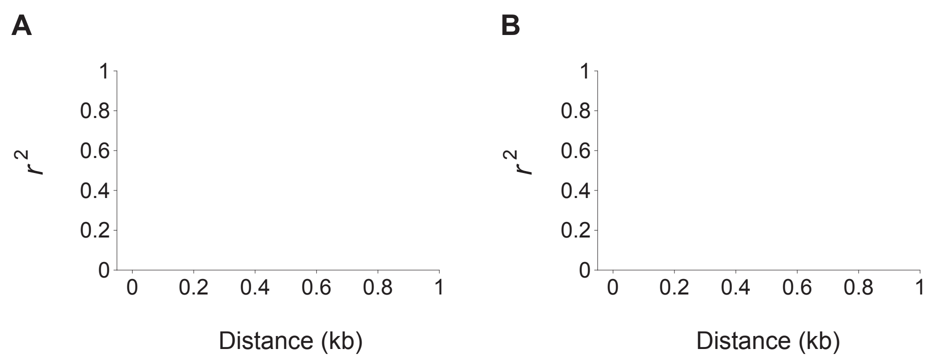
Supplemental Figure 5 Q-Q plot for $-\log_{10}$-scaled *P*-values with (*x*-axes) and without (*y*-axes) bottleneck in GBS data. Under Model I. (A) Mexico (B) South America.



Supplemental Figure 6 Q-Q plot for $-\log_{10}$-scaled *P*-values in MaizeSNP50 data. (A, B) Q-Q plot of *P*-values with and without correlation of ascertainment bias (on the *x*- and *y*-axes, respectively) in Mexico (A) and South America (B). (C, D) Q-Q plot of *P*-values from Syngenta SNPs on the *x*-axes and from Panzea SNPs on the *y*-axes in Mexico (C) and South America (D). The solid lines represent *y*=*x*.



Supplemental Figure 7 (A) Frequency distribution of P_M given $P_S < 0.01$ and $P_S \geq 0.01$. (B) Frequency distribution of P_S given $P_M < 0.01$ and $P_M \geq 0.01$.



Supplemental Figure 8 Pattern of decay of linkage equilibrium in Mexico (A) and South America (B). Red and blue dots represent low- and highland population, respectively. r^2 values were calculated as a statistics and averaged within 10-bp bins of distance between SNPs. The *x*- and *y*-axes represent distance between SNPs (kb) and average r^2 values.
